Lockable test button and mechanical flag indicator (0040, 0050, 0054, 0070, 0074)

The dual-purpose Finder test button can be used in two ways:

Case 1) The plastic pip (located directly above the test button) remains intact. In this case, when the test button is pushed, the contacts operate. When the test button is released the contacts return to their former state.

Case 2) The plastic pip is broken-off (using an appropriate cutting tool). In this case, (in addition to the above function), when the test button is pushed and rotated, the contacts are latched in the operating state, and remain so until the test button is rotated back to its former position.

In both cases ensure that the test button actuation is swift and decisive.

Contact specification
F 60 -Electrical life (AC) v contact current

H 60 -Maximum DC1 breaking capacity

- When switching a resistive load (DC1) having voltage and current values under the curve, an electrical life of $\geq 100 \cdot 10^3$ can be expected.
 - In the case of DC13 loads, the connection of a diode in parallel with the load will permit a similar electrical life as for a DC1 load.
- Note: the release time for the load will be increased.

Current sensing version

Typical application with current sensing relays.
 An open circuit filament of lamp L₁ is detected by the current sensing relay coil (K₁) which causes the back-up safety lamp L₂ to be energised, and indication of failure at the control panel via lamp S₁.
 Example: navigation light.
 L₁ = Light
 L₂ = Safety light
 S₁ = Control light
